TITLE: Experiments in the world magnetic survey program

SOURCE: Vsesoyuznaya konferentsiya po fizike kosmicheskogo prostranstva. Moscow, 1965. Issledovaniya kosmicheskogo prostranstva (Space research); trudy konferentsii. Moscow, Izd-vo Nauka, 1965, 606-614.

TOPIC TAGS: geomagnetic field, geomagnetism, secular magnetic field, secular magnetic variation, artificial earth satellite, aeromagnetometer, proton magnetometer, PM 4 magnetometer, PM 5 magnetometer

14 10 14

ABSTRACT: A brief review is given of the various attempts to obtain a worldwide magnetic-field map. The use of artificial earth satellites to map the earth's magnetic field is shown to be the most efficient of the various methods used. For optimum efficiency in a single experiment, a satellite must have an orbit inclined to the equatorial plane by 85°, as had several of the Cosmos series. The low-number Cosmos series (such as Cosmos-26) carried proton magnetometers aboard, which essentially measure the frequency of proton-free precession in the earth's magnetic field. The disadvantages of this type of magnetometer were

Card 1/2

44 33 17

L 2992-66

ACCESSION NR: AT5023643

4

alleviated in the later Cosmos series (Cosmos-49), by using self-tuning magnetometers with logic circuits. One such device, designated PM-4, automatically selects and analyzes the optimum signal during a part of the free nuclear precession period of the proton. Two such devices on Cosmos-49, set 90° apart, had a measurement accuracy of 2-3 gauss. Magnetic field measurements were taken by both the Cosmos-26 and -49 vehicles at altitudes of 270-403 km and 270-490 km respectively, during March and October of 1964. Typical magnetograms from these measurements are shown separately. Recommendations are made for further scientific investigations with magnetic-field charts to better determine the earth's geomagnetic field and to correct the coefficients of the Gaussian series. PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy Ministerstva vysshego obrazovaniya SSSR, Matematika, 1958, № 2, pp 3-4 (USSR)

ABSTRACT: The authors consider conditions under which the difference of two arbitrary solutions of

$$(1) \quad y'' = f(x,y)$$

has not more than one zero on the given interval (a,b) . With the notations of the paper of Asbelov and Tsalyk [Ref. 1] the authors formulate and prove two theorems in which the problem for (1) is reduced to the same problem for $y'' - qy = 0$, where q is a certain constant depending on $f(x,y)$. The results of [Ref. 1] are used essentially.

Epilepsy and Neuropsychic Illnesses in Children."

Bucharest, Studii si Cercetari de Inframicrobiologie, Vol 17,
No 3, 66, pp 181-187.

Abstract: The authors studied experimentally and serologically
129 cases of epilepsy and 85 cases of patients suffering from
other neuropsychic disorders with the aim of determining whether
rickettsial and pararickettsial organisms play any part in the
etiology of the diseases. The results were not conclusive but
lead the authors to suggest a strong possibility that an in-
fectious microbial factor is involved.

TITLE:

The Future Application of Ferrites in a Television
Synchrogenerator (Perspektivy primeneniya ferritov
v televizionnom sinkhrogeneratore)

PERIODICAL:

Nauchnyye doklady vysshey shkoly, Radiotekhnika i
elektronika, 1958, Nr 3, pp 154-161 (USSR)

ABSTRACT:

The author reviews the possible application of ferrites with a rectangular hysteresis loop in a television synchrogenerator. Here, these ferrites may be used in frequency divider circuits, pulse-shaping networks, grid synchronization circuits, circuits for the mutual synchronization of two synchrogenerators. First, the author reviews some pulse networks with ferrites, known from computer engineering, since the television synchrogenerator is based on a similar principle. Figure 1 shows a one-cycle shift register network, and figure 3 a dynamic trigger with one ferrite core. Then, the author presents two block diagrams for different versions of frequency dividers

Card 1/2

SOV/162-58-3-21/26

The Future Application of Ferrites in a Television Synchrogenerator

and one block diagram of a network producing control pulse sequences. The author points out the advantages of ferrites, especially since they reduce the number of vacuum tubes by 7-8 times. For example, the GS-14 synchrogenerator presently used had 43 vacuum tubes, whereby 5-6 tubes may be eliminated. Ferrites may find a wide-spread application in industrial television apparatus, since they permit the construction of simplified synchrogenerators. There are 7 diagrams, 3 graphs and 3 Soviet references.

AUTHORS: Chinenkov, L.A., and Demin, E.A.

TITLE: The Question of the Correcting Power of Start-Stop Telegraph Equipments (K voprosu ob ispravlyayushchey sposobnosti startstopnykh telegrafnykh apparatov)

PERIODICAL: Elektrosvyaz', 1958, Nr 9, pp 63 - 65 (USSR)

ABSTRACT: It is shown that with a normal law of distribution of distortion of signals the effective correcting power of a start-stop equipment is less than the nominal value by a factor of $\sqrt{2}$ times. If $W(\varphi)$ is the probability density of distortion of signal then the probability that a random excursion φ exceeds or is equal to some fixed level δ is given by (1). If the correcting system is assumed to act perfectly and there is no distortion of the correcting signal then when the correcting power has its nominal value ($\delta = \mu$) we find the probability of erroneous recording as (2). It should be noted that the upper limit of this integral is infinity while in practice there will be a finite maximum. The simplification is justified however. The distortion will be greatest when the condition shown in Fig 1 obtains and the signs of the distorted starting signal and coded signal are in

Card 1/2

SOV/106-58-9-10/17

The Question of the Correcting Power of Start-Stop Telegraph Equipments

opposition. When the correcting signal is distorted (2) becomes (4). This latter expression is difficult to evaluate and it is preferable to introduce the concept of an averaged value of operating correcting power, defined by (5). If it is assumed that the presence of fluctuation noise distorts the signals according to a normal law, then (2) becomes (2a). The reduction from (6) to (12) then shows that the effective average correcting power in the presence of fluctuation noise is less than the nominal value by a factor of $\sqrt{2}$ times. There are: 1 figure, 4 references, all Soviet.

Ed.: P. N. Men'shikov; Tech. Ed.: Ye. M. Gostishcheva.

PURPOSE: This book is intended for readers acquainted with
radio electronics and interested in new technical developments.

COVERAGE: The book examines the operating principles of
ferrite and semiconductor pulse devices used in various
fields of radio electronics, particularly in radio and
communications engineering. Special attention is paid
to the joint use of semiconductors and ferrites with a
rectangular hysteresis loop. No personalities are mentioned.
There are no references.

AUTHORS: Chinenkov, L.A., Demin, E.A.

TITLE: A Phase Discriminator Containing Magnetic Elements
With Rectangular Hysteresis Loops

PERIODICAL: Nauchnyye doklady vysshey shkoly, Radiotekhnika i
elektronika, 1959, Nr 1, pp 206-210

ABSTRACT: The authors describe a phase discriminator circuit composed of ferrite cores with rectangular hysteresis loops, as shown in Fig 2. Such a phase discriminator may be used in multi-channel communication systems and for remote controls. The conventional phase detector circuits used in radio engineering cannot be used in telegraphy, since the incoming signals are not periodic ones. The circuit recommended by the authors is simple, reliable and economical, since the ferrite cores require power only during the remagnetization. The phase discriminator circuit was subjected to laboratory tests which showed its advantages over other existing circuits. The authors explain briefly another ver-

sion of a phase discriminator combined with a polarized telegraph relay, shown in Fig 1. The mechanical relay may be replaced by an electronic relay and transistorized coincidence circuits. However, the electronic circuits are complicated and uneconomical. There are 2 circuit diagrams and 3 graphs.

TITLE: Frequency Dividers using Ferrites and Transistors
(Deliteli chastoty s primeneniem ferritov i
poluprovodnikovykh triodov)

PERIODICAL: Elektrosvyaz', 1959, Nr 6, pp 11-17 (USSR)

ABSTRACT: The article describes several variants of "ring", i.e. closed, shift register circuits which utilise the rectangular hysteresis loop characteristics of ferrites. These circuits can be used for counting down (frequency division) and for time switching. The basic circuit is shown in Fig 1. In the initial condition, one of the cores is magnetized, i.e. in state 1, and the remainder are in state 0. Under the action of each driving pulse, which endeavours to convert all the cores to the state 0, the state 1 is passed through the four-terminal network to the next core. The frequency of the output pulses (Fig 2) is three times lower than the frequency of the driving pulses and the output pulses of each stage are time-shifted relative to the output pulses of the next stage by 1/3 of a period. For reliable operation, it is necessary to ensure that the 1 state is registered on one of the stages and that any other surplus 1 states

Card 1/3

SOV/106-59-6-2/1⁴

Frequency Dividers using Ferrites and Transistors
are erased. This can be achieved manually or
automatically. To eliminate the undesirable effects of
noise, due to the hysteresis loops not being perfectly
rectangular, it is usual to use a noise compensation
circuit, but in frequency dividers this phenomenon can be
used for self-resetting. Since the noise affects all
stages, it is necessary to provide circuits to suppress
any surplus 1 states. Fig 3 shows a ring circuit for a
frequency divider, counting down 5 times, with automatic
reset, designed on the basis of a single-path shift
register with controlled discharge circuits (Refs 3, 6).
The circuit is described and practical details listed.
This circuit with some additions was used as a frequency
divider for a television synchro-oscillator (Fig 4).
The driving pulses were produced by a semiconductor
blocking oscillator (3125 c/s). The circuit is fully
described and oscillograms of the waveforms given.

Registry sdvig na ferritovykh serdechnikakh v radiotekhnike (Shift Registers with Ferrite Cores in Radio Engineering) Moscow, Gosenergoizdat, 1960. 86 p. 15,000 copies printed.

Ed.: Yu. I. Vizun; Tech. Ed.: K. P. Voronin. Reviewer: A. A. Pashkov, Engineer.

PURPOSE: This book is intended for technical personnel and students in schools of higher education.

COVERAGE: The book deals with ferrite-core pulse circuits with a rectangular hysteresis loop used in radio engineering. The operation of shift registers and their use as frequency dividers, time switches, and pulse-shaping devices are reviewed in detail. Special attention is paid to the reliability of the circuits described, and to the combined use of ferrite cores and semiconductor devices. The book is based on Soviet and non-Soviet sources, although part of it is original and appears for the first time.

TITLE:

A TV Synchronizing Generator Assembled on Ferrites and Semiconductors

PERIODICAL: Tekhnika kino i televideniya, 1960, No. 3, pp. 53 - 57

TEXT: The authors describe the design of a TV synchronizing generator assembled on semiconductors and ferrites with a rectangular hysteresis loop. The generator was developed by the Nauchno-issledovatel'skaya laboratoriya No. 2 Novosibirskogo elektrotekhnicheskogo instituta svyazi (No. 2, Scientific Research Laboratory of the Novosibirsk Electrotechnical Institute of Communications). The synchronizing generator consists of a quartz-stabilized master oscillator, 2 pulse generators, 3 delay lines, 2 frequency dividers, 1 shift register, 3 dynamic flip-flops, 2 pulse adders and 1 trigger. The synchronizing pulses correspond to the Soviet TV-standard, ГОСТ 7845-55 (GOST 7845-55). The cells in the circuits consist of toroidal cores made of ПП-24 (PP-24) ferrites, 4 mm in diameter, Д18 (D1V) germanium diodes, П13А (P13A) transistors and 6М (BM) capacitors, 0.02 μ F. The master oscillator, output amplifiers, and trigger units are

Card 1/2

A189/A026

A TV Synchronizing Generator Assembled on Ferrites and Semiconductors

transistorized. The trigger units are assembled on П403 (P403) diffused transistors to obtain output pulses with a front duration not exceeding 0.2 μ sec. In all, the synchronizing generator contains two 6H1N (6N1P) double triodes, 56 ferrite cores, and 40 transistors. Laboratory tests indicated that the frequency dividing and pulse-forming units of this generator have a stable operation within a 10% fluctuation of the supply voltage and at variations of the working temperature from +10 to +60°C. There are 4 figures and 3 Soviet references.

TITLE: Method of correcting errors occurring at junctions of meteor bursts in meteoric radiotelegraphy equipment. Class 21, No. 175081		
SOURCE: Byulleten' izobreteniij i tovarnykh znakov, no. 19, 1965, 25		
TOPIC TAGS: radio communication, <u>meteoric burst communication</u> 55, 12 [DW]		
ABSTRACT: The proposed method of correcting errors occurring at junctions of meteor bursts in equipment for meteoric radiotelegraphy is based on the repetition at the beginning of each transmission of the code combinations transmitted at the end of the preceding transmission. In order to reduce the distortions at the end of the bursts, the transmitted code combinations are counted at the transmitting end, and the correctly received code combinations are counted at the receiving end of the system. At the beginning of each burst, the last digit of the number of the transmitted combinations is transmitted and compared at the receiving end with the last digit of the number of correctly received combinations, establishing the number of the code combination with which to begin reception. TITLE: Memory devices for systems of meteoric radiotelegraph communications

SOURCE: Operativnyye i postoyannyye zapominayushchiye ustroystva (Rapid and non-volatile storage); sbornik statey. Leningrad, Izd-vo Energiya, 1965, 117-121

TOPIC TAGS: meteoric communication memory, fast reading memory, slow recording memory, standby memory, radiotelegraphy

ABSTRACT: Proposed meteoric radiotelegraph communication links require buffer memories which make possible a continuous transfer of information over a discontinuous communication channel. The memory on the transmitter side should have a high reading rate and slow recording speed while the memory on the receiver side should operate in the reverse manner. The memory described in this article can carry out simultaneous recording and reading of information and can be started and stopped almost instantaneously. With a capacity of 900 code combinations it is relatively simple while, nevertheless, it causes only insignificant reductions in the communication channel transfer rate. It utilizes direct sampling and has five operating digits plus one control digit. Orig. art. has: 3 figures.

TITLE: Use of apparatus for reinforced concrete pretensioned constructions with closely grouped reinforcement. (Opyt ekspluatatsii oborudovaniya dlya zhelezobetonnykh napryazhennykh konstruktsiy s puchkovoy armaturoy).

PERIODICAL: "Mekhanizatsiya Stroitel'stva" (Mechanisation of Construction), 1957, Vol.14, No.5, pp.6 - 8 (USSR).

ABSTRACT: A double-action jack, manufactured by Glavstroymekhanizatsiya Minmertallurgkhimstroy, is used for the pretensioning of reinforcement of reinforced concrete frames of 27 m span. The pressure installations for the jack and hand-guns for injecting cement grout into the channels were manufactured by a factory of the Ministry of Building and Road Building Machinery (Ministerstvo Stroitel'nogo i Dorozhnogo Mashinostroyeniya). The double-action jack was designed for the tensioning of reinforcement in "bundles" of 12 of 3-5 mm diameter wires. It comprises a pressure cylinder, an anchoring mechanism and a wedging mechanism (of conical shape). The wires are spaced evenly in grooves of the collar of the anchoring cone. On the application of pressure the conical head of the jack presses against the

Card 1/3

100-5-2/10

Use of apparatus for reinforced concrete pretensioned constructions with closely grouped reinforcement. (Cont.)

the pressure cylinder move in reverse thus performing the tensioning. The capacity of the jack = 30 tons, the maximum movement = 300 mm. The maximum tension on the wedges = 12 tons, the piston movement of the anchoring = 50 mm, the jack is resting on a base of 40 cm². Results of the calibration of the jack are shown in Diagram 3. The discrepancy between theoretical and practical curves of calibration when loading with 10 - 30 tons = 1.9 tons. The bottom reinforcement of the above mentioned frame has 5 "bunches", each containing 12 wires of 5 mm diameter. Each "bunch" is tensioned to 18 - 20 tons, corresponding to the overall loading of 91 tons on the bottom layer. If the theoretical calibration is used for the tensioning each "bunch" is tensioned up to 2.1 t less, i.e. the total tensioning of the lower layer of the frame would be 11 - 12% smaller and the factual coefficient of safety against crazing would be between 1.07 - 1.08 instead of 1.2. It is recommended, therefore, that each jack should be checked before use. The pumping mechanism "CM-528" is designed for the double-action jack, but the hand-operated pump T-57 can also be used. AUTHOR: Chinenkov, Yu.V., Candidate of Technical Sciences**TITLE:** Tests of Prestressed Reinforced Concrete Slabs Used as Roofs of Industrial Buildings (Ispytaniye predvaritel'no napryazhennykh zhelezobetonnykh plit dlya pokrytiy proizvodstvennykh zdaniy).**PERIODICAL:** Beton i Zhelezobeton, 1958, Nr.12, pp.458-461 (USSR)**ABSTRACT:** Roof slabs (type PK 01-12) measuring 3 x 6 m (see Fig.1), designed by GIPROTIS, are used for flat industrial roofs where normal loading is 270, 380, 490 and 680 kg/m² (Table 1). The supporting ribs of the slabs are reinforced by high tensile steel wire of 5 mm diameter with a stress limit of 14,500 kg/cm² (GOST 8480-57). Apart from the tensioned reinforcement in the rib there is ordinary reinforcement of cold rolled 5 mm diameter rods and stirrups, of steel mark 25G2S. The slab is reinforced with 2 welded meshes 1,500 mm wide made from cold rolled wires. Concrete mark 400 is used for these slabs; their weight is 2.85 t. The calculation of the slab was carried out in accordance with TsNIPS' (I.148-52), "Instructions on Design of Prestressed Reinforced Concrete Constructions". The

Card 1/3

SOV/97-58-12-5/13

Tests of Prestressed Reinforced Concrete Slabs Used as Roofs of
Industrial Buildings.

coefficient of resistance to crack formation was 1.2, and the margin of safety 2.1-2.2. The reinforcement was tensioned to 10,000 kg/cm², and when curing was applied, to 11,500 kg/cm². Slabs were produced and tested in the factory for reinforced concrete constructions of the Stalinskpromstroy Trust of the Kemerovskiy Sovnarkhoz (zavod zhelezobetonnykh konstruktsiy tresta Stalinsk-promstroy Kemerovskogo sovnarkhoza) in 1957. Fig.2 illustrates the scheme according to which the slabs were tested. The strength of the concrete at the time of releasing the tensioned reinforcement is given in Table 2. Fig.3 illustrates the ways in which cracks are formed along the ribs of the roof plates when subjected to loading tests. Fig.4 gives a graph showing deformation curves for the top of the rib of a combined slab type PKZhN-3. Fig.5 shows curves for various slabs and the relationship between deformation and loading. Deflection of the slab PKZhN-4 under the standard loading was 8 mm, and of slab PKZhN-3, 4.4 and 4.2 mm. A detailed description

Card 2/3

Tests of Prestressed Reinforced Concrete Slabs Used as Roofs of
Industrial Buildings.

SOV/97-58-12-5/13

of various tests carried out on both types of slabs is given. The tests showed that the strength and the resistance to crack formation of factory produced slabs correspond to the calculated values. To economise cement it is advisable to use "combined" types of slabs, in which the longitudinal ribs are made from concrete which acquires in a short time sufficient strength to withstand the stresses of pretensioning and also the stresses from the transverse ribs and the slab itself. There are 5 figures and 2 tables.

AUTHOR: Chinenkov Yu.V., Candidate of Technical Sciences

TITLE: Problems of Reinforcing Concrete Units Subjected to Combination of Bending and Torsion

PERIODICAL: Beton i zhelezobeton, 1960, Nr 1, pp 35 - 37 (USSR)

ABSTRACT: "Normy i tekhnicheskie usloviya proyektirovaniya zhelezobetonnykh konstruktsiy" (NiTU 123-55) ("Norms and Technical Requirements for Designing Reinforced Concrete Constructions" (NiTU 123-55)) recommend use of closed stirrups when reinforcing concrete units subjected to torsion with overlapping ends by the length of 30 diameters. Investigations carried out in the Institut betona i zhelezobetona ASIA SSSR (Institute for Concrete and Reinforced Concrete ASIA of USSR) by the author of this article together with Candidate of Technical Sciences N.N.Lessig under the leadership of Professor A.A.Gvozdev, proved that in the case of small torsion moments which usually occur in practice, the rigid constructional requirements do not need to be followed. The first group of testing samples were beams of rectangular cross-section, reinforced in the investigated zone by two narrow assembled reinforcement positioned along the side of the beam. In the second group, the narrow assembled reinforcement was coupled into spacial

Card 1/4

69035
S/097/60/000/01/011/017

Problems of Reinforcing Concrete Units Subjected to Combination
of Bending and Torsion.

reinforcement by welding them together. The torsion moment was constant along the whole length of the beam and differed according to various samples, i.e. 10, 20, 30 and 40% of the magnitude of bending moment. The increased loading on the samples of first and second group caused bending, which in some cases resulted in cracks. Collapse of samples reinforced with two narrow assembled reinforcement occurred in two ways. In the first case both longitudinal and cross reinforcement reached the point of yield. The compressed edge (by bending) collapsed by crushing of concrete. In the second case, during collapse of samples due to the crushing by bending, wide oblique cracks appeared, but under this loading the reinforcement did not reach the point of yield (Figure 1a). In all the samples reinforced by rods and closed stirrups, the collapse occurred after the point of yield of the reinforcement and stirrups was reached; the appearance of oblique cracks due to the compression and bending, did not in this case cause collapse (Figure 1b). There were parts of testing samples where both bending and torsion moments appeared,

Card 2/4

69035

S/097/60/000/01/011/017

Problems of Reinforcing Concrete Units Subjected to Combination
of Bending and Torsion

as well as parts subjected only to torsion. Tests showed that together with the appearance of cracks in the zone of pure torsion, or during somewhat greater loading, cracks appeared due to the compression under bending in parts where both bending and torsion moments existed. The formula of Sen-Venan will be used when calculating main tension stresses in rectangular units subjected to torsion using experimental co-efficient 1.6. Formula is given and explained. Swedish scientist Nilender first showed on tests carried out on "T" shape cross-sections that it is justifiable to assume for this purpose that the concrete is ideally plastic material. Under this assumption, the formula for calculating the magnitude of torsion moment corresponding with the appearance of cracks is simple. Formula for rectangular cross-section is given. Graphs in Figure 2 show comparison of moments at the time when cracks appear, calculated according to formulae (1 and 2). These graphs show that when ratio of $b : h > 0.6$ the values of moments obtained using emperic formula are higher than possible limit values of moments obtained under the assumption of totally uniform distribution of internal stresses.

Card 3/4

69035
S/097/60/000/01/011/017
Problems of Reinforcing Concrete Units Subjected to Combination
of Bending and Torsion

This was proved to be correct by analysis carried out on reinforced concrete square, oblong, circular and ring-shape samples. The following conclusions can be drawn: if the magnitude of torsion moment in units was subjected to simultaneous bending, and torsion exceeds the magnitude of moment corresponding to appearance of cracks, then it is necessary to use closed stirrups. The placing of stirrups should not be wider than the width of the horizontal side; the moment at the time of appearance of cracks could be defined according to formula for plastic torsion. There are 2 figures.

FRENKEL', I.M., kand. tekhn. nauk; MIRONOV, S.A., doktor tekhn. nauk, prof.; BARANOV, A.T., kand. tekhn. nauk; BUZHEVICH, G.A., kand. tekhn. nauk; MIKHAYLOV, K.V., kand. tekhn. nauk; MULIN, N.M., kand. tekhn. nauk; KHAYDUKOV, G.K., kand. tekhn. nauk; KORNEV, N.A., kand. tekhn. nauk; TESLER, P.A., kand. tekhn. nauk; HERDICHEVSKIY, G.I., kand. tekhn. nauk; VASIL'YEV, A.P., kand. tekhn. nauk; LYUDKOVSKIY, I.G., kand. tekhn. nauk; SVETOV, A.A., kand. tekhn. nauk; CHINENKOV, Yu.V., kand. tekhn. nauk; BELOBROVYY, .K., inzh.; KLEVTSOV, V.A., inzh.; DOBROMYSLOV, N.S., arkh.; DESOV, A.Ye., doktor tekhn. nauk, prof.; LITVER, S.L., kand. tekhn. nauk; PISHCHIK, M.A., inzh.; SKLYAR, B.L., inzh.; POPOV, A.P., kand. tekhn. nauk; NEKRASOV, K.D., doktor tekhn. nauk, prof.; MILOVANOV, A.F., kand. tekhn. nauk; TAL', K.E., kand. tekhn. nauk; KALATUROV, B.A., kand. tekhn. nauk; KARTASHOV, K.N., red.; MAKARICHEV, V.V., kand. tekhn. nauk, red.; YAKUSHEV, A.A., inzh., nauchnyy red.; BEGA, B.A., red. izd-va; NAUMOVA, G.D., tekhn. red.

[Reinforced concrete products; present state and prospects for development] Zhelezobetonnye konstruktsii; sostoianie i perspektivy razvitiia. Pod obshchei red. K.N. Kartashova i V.V. Makaricheva. Moskva, Gosstroizdat, 1962. 279 p.
(MIRA 15:8)

(Continued on next card)

FRENKEL', I.M.---(continued) Card 2.

1. Akademiya stroitel'stva i arkhitektury SSSR. Institut betona i zhelezobetona, Perovo.
2. Chlen-korrespondent Akademii stroitel'stva i arkhitektury SSSR (for Kartashov).
3. Chlen-korrespondent Akademii stroitel'stva i arkhitektury SSSR (for Mironov).
4. Gosudarstvennyy institut tipovogo proyektirovaniya i tekhnicheskikh issledovaniy (for Berdichevskiy, Vasil'yev, Lyudkovskiy, Svetov, Chinikov, Belobrovyy, Klevtsov, Dobromyslov).
4. Vsesonuznnyy gosudarstvennyy proyektno-konstruktorskiy institut (for Desov, Litver, Pishchik).

(Precast concrete)

CHINENKOV, Yuriy Vasil'yevich, kand. tekhn. nauk; ZHIV, Aleksandr Semenovich; HORODINA, I.S., red.izd-va; KOMAROVSKAYA, L.A., tekhn. red.

[Precast cylindrical shells of light and cellular concrete]
Sbornye tsilindricheskie obolochki s primeneniem legkogo i
iacheistogo betonov. Moskva, Gosstroizdat, 1963. 78 p.
(MIRA 16:8)

(Roofs, Shell)

CHINENKOV, Yu.V. [Cinenkovas, J.]; DAUDYARIS, P.P. [Dauderys, P.]

Study of the joints and elements of precast cylindrical shells
made from light or cellular concretes. Trudy AN Lit. SSSR. Ser.
B no. 1:205-223 '63. (MIRA 17:5)

l. Institut stroitel'stva i arkhitektury AN Litovskoy SSSR.

GORENSHTEYN, B.V., kand.tekhn.nauk; CHINENKOV, Yu.V., kand.tekhn.nauk;
ABOVSKIY, V.P., inzh.; GUTOVSKIY, E.V., inzh.; NOVIKOV, V.S.,
inzh.; PESHKIN, I.G., inzh.

Use of long cylindrical precast prestressed concrete shells. Prom.
stroi. 40 [i.e. 41] no.4:13-17 Ap '63. (MIRA 16:3)
(Roofs, Shell)

"APPROVED FOR RELEASE: 06/12/2000

CIA-RDP86-00513R000308820005-5

CHINENKOV, Yu.V., kand.tekhn.nauk

Precast slanting shells. Prom.stroi. 41 no.9:19-21 S '63.
(MIRA 16:11)

APPROVED FOR RELEASE: 06/12/2000

CIA-RDP86-00513R000308820005-5"

"APPROVED FOR RELEASE: 06/12/2000

CIA-RDP86-00513R000308820005-5

CHINENKOV, Yu.V., kand. tekhn. nauk; NOVIKOV, V.S., inzh.

Testing of cylindrical shells for concentrated loads. Prom.
stroi. 42 no.3:32-37 '65. (MIRA 18:7)

APPROVED FOR RELEASE: 06/12/2000
